LAB 7 – FUZZING FOR INPUT VALIDATION BUGS

Coupon Validator – Screenshot Evidence

The following evidence shows the original application, bugs discovered through Hypothesis fuzz testing, the corrected application, and the final passing test run.

1. Original Application Output

Initial execution of the coupon validator before fuzz testing and fixes.

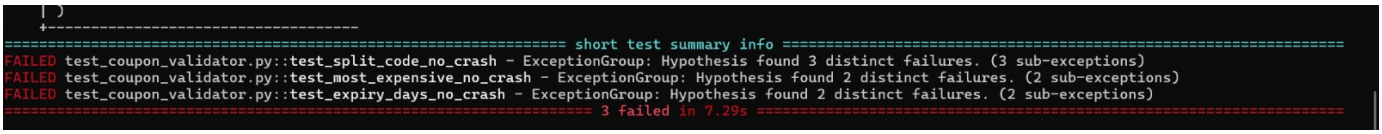

```
C:\Users\sudhe kareppagol\L6_L7_31_coupon_validator\lab7>python coupon_validator.py
==== Running split_code ====
Enter a coupon code (e.g. save-20): save-20
Prefix and Value: ('SAVE', 20)

==== Running most_expensive ====
Enter item prices as CSV (e.g. 199,49.5,320): 199,49.5,320
Most Expensive Item: 320.0

==== Running expiry_days ====
Enter an expiry date as YYYY-MM-DD: 2025-06-15
Days Since 2024: 530
```

2. Failing Hypothesis Tests

Hypothesis identified invalid inputs that caused the original functions to fail.

3. Fixed Application Output

Execution after updating input validation and date handling.

```
C:\Users\sudhe kareppagol\L6_L7_31_coupon_validator\lab7>python coupon_validator.py
==== Running split_code ====
Enter a coupon code (e.g. save-20): save-20
Prefix and Value: ('SAVE', 20)

==== Running most_expensive ====
Enter item prices as CSV (e.g. 199,49.5,320): 199,49.5,320
Most Expensive Item: 320.0

==== Running expiry_days ====
Enter an expiry date as YYYY-MM-DD: 2025-06-15
Days Since 2024: 531
```

4. Passing Hypothesis Tests

All three fuzz tests pass after the application fixes.
